A: You can download the required version at They have the following comment: You can also download the Windows binaries for the official zlib distribution, and list of supported platforms here. This version of zlib is compatible with both the official zlib and the zlib that are distributed with Microsoft Visual C++ (Visual Zlib). The official zlib is a modified version of the MIT's zlib. The difference is that the original zlib cannot be linked to the Unicode version of the Microsoft compiler. This version of the official zlib includes the Unicode version of the Microsoft compiler, and therefore can be linked to the Unicode version of the Microsoft compiler. The above comment is the key to using zlib for.NET. I use this version myself on Windows Server 2003. UPDATE: Microsoft removed the previous link to their source code. They currently offer this zip file on their zlib site. Q: I'm a new blender artist, and I need your help on creating a custom pose animation with a cloth simulation and hair I'm creating a custom character for a film that uses a few poses. I have a simple model. I'm trying to create a custom animation. The models have a simple cloth simulation which helps me animate different poses. The main model is in the third picture. In the second picture, the models is in different poses. So, what I want is to blend between the different poses of the models to create a new pose. I tried to record my mouse but the result looks like a mix between all the animation and I'm not sure if it would work. Do you have any advice on what would be the best way to achieve this? On the fly? You might do this by recording a scene with all the poses and once the animation is done you interpolate the different scenes together to create a blend between them. You can use that blend to manipulate the poses of your current scene, hence you can go back and forth, modifying the positions, rotation and other morph properties of your characters to get a better fit. On the fly in the viewport If you record your current scene and you want to animate in the viewport using the simple cloth simulation you can simply create a blend file between the recorded poses and use the 82157476af
